NCFPD Overall Project Plan

Abstract/Executive Summary: The proposed continuation of this project aims to optimize the cleaning process by comparison of existing methods with different cleaning agents (product and process specific) in conjunction with high-power ultrasound, to further facilitate removal of food residues to improve sanitizer/sterilant efficiency. Further steps will be taken to scale-up the application of the vaporized/gaseous sterilants (vaporized hydrogen peroxide, ozone, chlorine dioxide and formaldehyde) to eliminate remaining spores in food residues attached to processing surfaces after cleaning treatments.

Optimization of this potential non-invasive cleaning-sanitizing strategy for removal and inactivation of *B. anthracis* (Sterne strain) could provide a less destructive alternative for decontamination of food processing equipment in the event of a biological threat in food processing facilities. This application could potentially save both time for remediation and offset the potential financial impact caused by the loss of critical capital items.

Primary Goal: To validate the effects of various cleaning and liquid/gaseous sanitizing protocols for decontamination of food processing equipment and facilities with spores of several potential surrogate *Bacillus* species including *B. anthracis* Sterne strains.

Objectives: To compare the effects of various vaporized and gaseous sterilants to sanitize cleaned surfaces in scaled-up, simulated but near-real world situations.

Introduction and Highlights: In a previous NCFPD-funded project, we investigated: (1) the formation of “biofilms” consisting of *Bacillus* spores (*B. cereus* ATCC 21281 and *B. thuringiensis* ATCC 33680) embedded in complex food matrices on different food contact surfaces and the ability of cleaning regimens to remove spores in food (Xie et al., 2007); and (2) the effects of liquid and gaseous/vaporized sanitizers (or sterilants) to inactivate spores on clean and non-clean surfaces (Oh et al., 2007).

Sanitizing technologies to be included in this phase of the study include: vaporized hydrogen peroxide (Heckert et al., 1997; Rogers et al., 2005), ozone (Kim et al., 1999; Aydogan and Guroli, 2006), chlorine dioxide (Kreske et al., 2006b; Ryu and Beuchat, 2005), and paraformaldehyde (Ackland et al., 1980). Although ozone has been used as an anti-fungal fumigant applied to stored cereal crops (Allen et al., 2003; Wu et al., 2006), its use for facility fumigation has been rarely reported. Pan et al. (1992) reported that application of 600ppm ozone for 6 hours might be effective for routine sterilization of cages, bedding, clothing, and other materials in laboratory animal facilities. Khadre and Yousef (2001) compared the sporcidal actions of hydrogen peroxide and ozone, and found the former to be less effective against *Bacillus* spores even at 10,000x higher concentration.

Sanitizer challenge
All gaseous sterilants will be prepared and applied to simulated food contact surfaces according to manufacturer's instructions. Various concentrations and contact/application times will be assessed to determine appropriate end points and limits for detection (as described below). The following gaseous sterilants, or their equivalents, will be considered: Ozone (American Air Liquide - proprietary on-site generation)

Project Description

In 2001 a terrorist attack of distributing anthrax through the mail brought attention to the country that the use of spores as a weapon was feasible and the realization that steps have not been added in response to these possibilities. The food industry as a result began taking great strides in order to put methods in place that would allow for fast and easy response if any of these attacks were to ever affect their facilities. Anthrax which is the bacterial spore Bacillus anthracis can cause serious harm and even be deadly upon exposure. In case of any attacks within the food industry it is important to be prepared with steps such as a cleaning and sanitization process to quickly and efficiently eliminate the anthrax from any surfaces that it may come in contact with the spores. In order to simulate the contact surfaces, coupons made of stainless steel 316, glazed tile, Teflon, polypropylene, and rubber will be used as representatives of food contact surfaces. Due to Bacillus anthracis’ extremely virulent nature, surrogate strains will be used in this study that may be similar to Bacillus anthracis. These strains are Bacillus cereus ATCC 21281, Bacillus thuringiensis ATCC 33680, and Bacillus anthracis (Sterne strain). Food matrices that will be used are pancake mix, peanut butter, infant formula, vegetable oil, and a sucrose solution.

The use of ozone as a sanitizer for inactivation of Bacillus spores has been explored using different surfaces, but few studies have explored how it affects spores embedded in different food matrices. This is important because in most real world applications food matrices come in contact with many of the surfaces in the facilities and have the potential to become hardened and difficult to remove. Therefore a determination of the parameters, such as the contact time and ozone concentration required to inactivate the spores embedded in the food are very important in sanitizing. In order to determine this, an ozone delivery system must be designed to safely deliver and destroy the ozone.

Due to ozone’s instability and potential deadly affect if inhaled at a high dosage, it is important to construct a process to safely deliver and destroy the ozone. A system must be built for controlled delivery and destruction of the ozone to the spores inoculated on the coupons.
Project Description

In 2001 a terrorist attack of distributing anthrax through the mail brought attention to the country that the use of spores as a weapon was feasible and the realization that steps have not been added in response to these possibilities. The food industry as a result began taking great strides in order to put methods in place that would allow for fast and easy response if any of these attacks were to ever affect their facilities. Anthrax which is the bacterial spore Bacillus anthracis can cause serious harm and even be deadly upon exposure. In case of any attacks within the food industry it is important to be prepared with steps such as a cleaning and sanitation process to quickly and efficiently eliminate the anthrax from any surfaces that it may come in contact with the spores. In order to simulate the contact surfaces, coupons made of stainless steel 316, glazed tile, Teflon, polypropylene, and rubber will be used as representatives of food contact surfaces. Due to Bacillus anthracis’ extremely virulent nature, surrogate strains will be used in this study that may be similar to Bacillus anthracis. These strains are Bacillus cereus ATCC 21281, Bacillus thuringiensis ATCC 33680, and Bacillus anthracis (Sterne strain). Food matrices that will be used are pancake mix, peanut butter, infant formula, vegetable oil, and a sucrose solution.

The use of ozone as a sanitizer for inactivation of Bacillus spores has been explored using different surfaces, but few studies have explored how it affects spores embedded in different food matrices. This is important because in most real world applications food matrices come in contact with many of the surfaces in the facilities and have the potential to become hardened and difficult to remove. Therefore a determination of the parameters, such as the contact time and ozone concentration required to inactivate the spores embedded in the food are very important in sanitizing. In order to determine this, an ozone delivery system must be designed to safely deliver and destroy the ozone.

Due to ozone’s instability and potential deadly affect if inhaled at a high dosage, it is important to construct a process to safely deliver and destroy the ozone. A system must be built for controlled delivery and destruction of the ozone to the spores inoculated on the coupons.
Changes for Draft 1

- Valves needed to be added
  - Still not sure what types are required
- Add fume hood to the design
  - All items that are producing ozone should be under the fume hood
- Draw oxygen and nitrogen tanks
Ozone Design System - Corrections & Annotations for Draft 2

Stainless Steel 304 tubing throughout except between oxygen tank & ozone generator.
Changes for Draft 2 of Ozone Design System
April 1, 2008

- Types of valves needed
  - Needle valves – controls the flow of the system
  - Ball valves – allows for and stops flow of the gas through the system
  - Pressure release valves – can be set for the maximum pressure allowed for the tanks and will pop and release pressure if the maximum pressure is reached

- Add pressure gauge to monitor pressures before the ozone flows into the humidity tank
  - Humidity tank can only withstand 5psig

- Add a line connecting the ozone generator to the MnO₂ destruction tank
  - This will be used to destroy the ozone until the desired concentration is achieved

- The line connecting the anaerobic tank to the MnO₂ destruction tank is removed
  - MnO₂ is in the powdered form and the ozone flowing from the anaerobic tank is humidified which would wet and destroy the MnO₂

- The line connecting the catalyst tank and the destruction tank is removed
  - If there is backflow from the destruction tank, the MnO₂ will become wet and destroyed

- Stainless steel tubing should be used throughout the system since it will withstand ozone
  - Check Valex company for tubing

- Copper tubing can be used to connect the oxygen and ozone generator
  - Cheaper and does not require ozone compatibility
Changes from Draft 3

- The type of tubing used throughout the system needs to be identified
- The gauge is added before the humidity tank
- Addition of the buffer tank
  - When using the vacuum pump all the air will be removed from the anaerobic reaction tank. If the valve is opened to allow the ozone to flow into the reaction tank after vacuum pumping the ozone will flood into the tank and possibly over pressurize the tank.
  - The buffer tank will therefore act as a preventative measure by holding the ozone and then supplying the anaerobic tank with controlled flow
- Pressure release valve
  - Incorrect symbol so the PRV was modified on the anaerobic tank
  - Added to the buffer tank to prevent over pressurization
The draft P&ID/PFD and equipment list for the proposed ozone delivery system for NCFST was reviewed and the following comments resulted:

P&ID/PFD Diagram

1. The diagram need to annotate the nominal temperatures, pressures and flows which the various portions of the system will experience during normal operation.
2. Process line materials should be noted where the material of construction changes.
3. Relief valve and safety devices within the diagram should be annotated with their set points.
4. The relief valve on the anaerobic reactor should be shown to relieve into the fume hood.
5. If the vacuum pump is not necessary please remove it from the system, along with any other components which have been provided in support of the vacuum pump.
6. Show the two stage regulators on the oxygen and nitrogen tanks.
7. Move the pressure gauge immediately upstream of the humidifier vessel to upstream of the manual valve.
8. Number all valves, pressure, gauges, and components.
9. Indicate O3 analyzer in the environment

Equipment List

1. Provide the pressure rating and ozone production rates for the ozone generator.
2. Provide the dimensions and pressure rating of the buffer tank
3. Provide the pressure and flow rating for the ozone analyzer.
4. Provide the correct dimensions, and pressure rating for the anaerobic reactor.
5. Provide pressure ratings and flow limitations for the gas washing bottles.
6. The tubing, valves and fittings are of different sizes. Please verify the correct size for the tubing, valves and fittings.
7. Verify compatibility of all equipment and materials with the oxygen/ozone process stream.

-These comments were submitted from Vosuhi Rasanayagam and Ted Rebart of Air Liquide as a result of our conference call for the P&ID.
Conference Call with Air Liquide  
April 3, 2008

Discussion
1. Ozone Design
   a. Needs to be a Parts and Instrumentation Diagram (P&ID)
      i. Temperature, pressure, and flow rates displayed
      ii. Materials used for the process line (tubing type and size)
      iii. Set points for the relief valves
      iv. Move release valve within the fume hood
      v. Remove vacuum pump
      vi. Show pressure regulators on the oxygen and nitrogen tanks
      vii. Move pressure gauge to the buffer tank
      viii. Number the valves and gauges
2. Equipment List
   a. Ozone generator
      i. Pressure rating
      ii. Ozone production rates
   b. Buffer tank
      i. Dimensions
      ii. Pressure rating
   c. Ozone analyzer
      i. Pressure rating
      ii. Flow rate
   d. Anaerobic reactor
      i. Correct dimensions
   e. Gas washing bottles
      i. Pressure ratings
      ii. Flow limitations
      iii. Correct dimensions
   f. Correct the valve sizes
      i. Should be ¼ in
   g. Make sure all equipment is oxygen/ozone compatible
3. Hazard and Operability Study (HAZOP)
   a. Brief explanation was given on the purpose of conducting this study
   b. A P&ID with the correct information is required in order to correct
      develop the plan
4. Fittings
   a. Air Liquide will provide the fittings to be oxygen cleaned
   b. Submit a list of needed fittings
5. Air Liquide will send an example P&ID

Next Meeting
- Will determine the date of the next meeting upon progress of the P&ID and
  equipment ordering
- Submit updated P&ID before next meeting
Changes for Draft 4

- Removed the vacuum pump
  - From past studies it was found that spores are not affected by vacuum pumping therefore it was removed because it was more of a hazard to the system (oxygen compatibility of oil, over pressurizing the anaerobic reaction tank)
- Buffer tank still kept in place to effectively monitor the flow of the system
- Pressure gauge moved to the buffer tank
  - Pressure can be monitored in the tank and adjusted to specified flow by the needle valve placed before the humidity tank
- The PRV connected to the anaerobic tank is releasing outside the fume hood
  - Moved to release under fume hood
- Line added for the ozone passing through the ozone analyzer and sent to the MnO2 destruction tank
- The temperatures, flow rates, and pressures were added to indicate parameters along the system line (determined by the maximum conditions allowed for the parts)
OZONE DESIGN SYSTEM
Draft 3 Changes + Annotations

Date: 7/9/08
- Change to psig
- Couple lbs over atm

Comments on Proposed P&ID/PFD for Ozone Delivery System for NCFST
April 15, 2008

The revised P&ID/PFD and equipment list for the proposed ozone delivery system for NCFST was discussed and the following comments were made:

**P&ID/PFD Diagram**

1. The pressures, temperatures and flows indicated inside the compressed gas cylinders for oxygen and nitrogen should be moved to the appropriate lines downstream of the pressure regulators.
2. A check valve or some device should be placed downstream of the buffer tank and upstream of valve NV3 to prevent moisture from back flowing into the ozone analyzer.
3. The line and vessel pressures should be changed to psia vice psig to reflect the actual operating conditions.
4. The relief valve set points should be indicated for PRV1 and PRV2.
5. Verify the ozone generator flow rates of 0.04 – 0.96 Nm³/h are compatible with the desired system flow rate of 0.5 L/min.

- Comments submitted by Vasuhi Rosanayam and Ted Rekurt of Air Liquide.
Conference Call with Air Liquide – My Personal Notes
April 15, 2008

Discussion
1. Changes to be made to the P&ID
   a. Move the pressures and flow indicated inside the gas tanks to the line
   b. Check on the flow rates of the gas coming from the generator → conversions do not seem to be correct
   c. Add a check valve before needle valve (NV3) to prevent back flow of the humidified ozone into the MnO2 destruction tank
   d. The pressures are not correct and should be labeled psia or converted correctly to psig
   e. Indicate pressure release valve set points (PRV1, PRV2)
2. Equipment list
   a. Modify symbols for pressure and temperature ranges
   b. No removal or additions
3. Anaerobic Jar Lid
   a. Requested for Air Liquide to make adjustments to the jar lid
      i. Fill original holes and make them ¼ in NPT threads
      ii. Need an oxygen clean gauge as well
   b. Air Liquide agreed to make the changes and we will ship the item to them
4. Oxygen cleaning of the parts
   a. Buffer tank is dusty and needs to be cleaned
   b. Anaerobic tank needs to be cleaned
5. All items will be shipped to Air Liquide
   a. Buffer tank
   b. Anaerobic tank (cleaning and thread changes)
   c. Stainless Steel anaerobic tank (Chlorine dioxide unit)

Next Meeting
- Will meet again in 2 weeks (April 30, 2008)
- Submit updated P&ID before meeting
- Make changes to equipment list
- Continue ordering supplies
- Ship items to Air Liquide
Changes for Draft 5

- Parameters inside the oxygen and nitrogen tank are incorrect
  - Those are the desired parameters for flow through the tubing
- The pressures are incorrect
  - The readings are atmospheric pressure and not gauge pressure
  - 14.5 psia = 1.0 psig
- All valves are labeled and numbered accordingly
  - This is to help for easy references during building, discussions, and operations
- Check valve added into the system before valve NV3
  - This is to prevent backflow of the humidified ozone to the MnO₂ destruction tank
- Pressure regulator for the nitrogen and ozone tanks shown in the line
Conference Call with Air Liquide
May 2, 2008

Discussion
1. The P&ID is fine and there are no immediate changes to be made
   a. Vasuhi and Ted (Air Liquide) will proceed with the HAZOP
2. 3-A sanitary piping from McMaster Carr is fine to use
   a. As long as it is for a short length
   b. The item will be ordered immediately
3. Jar lid threads
   a. Email sent to Vasuhi concerning increasing the thread size to ½ in NPT
      for one connection → she will need to look into this in order to determine
      if it is possible
   b. If the thread will be ½ in then they will work to find the ½ in to ¼ in
      fitting (oxygen cleaned)
4. Oxygen cleaned parts
   a. Vasuhi is currently collecting the fittings
   b. Will hopefully ship next Friday (May 9, 2008)
5. Steve Fisher will be the local contact for the HAZOP
6. Need basic SOPs to write the HAZOP (startup and shutdown procedures)
   a. Email to Air Liquide on Friday, May 9, 2008
   b. Will receive their comments on May 14
7. Ozone Training
   a. Will be done the first week of June, either June 2 or 3
   b. Steve Fisher will be conducting the training
8. Team sheets should be done for the HAZOP
   a. Submit to Vasuhi with the names of the participants and their roles

Next Meeting
- Conference call on May 14, 2008
- Discuss the SOPs
- Finalize the date for the ozone training
Changes for Draft 6

- Set points for PRV1 and PRV2 are added
- Water flow into the ozone generator increased to 1.5 L/min
  - Correct conversion from the ozone generator manual
- Polyvinylidene fluoride (PVDF) tubing will be connected to the humidity tank and excess release tank
  - Tanks are glass and needs to be connected to flexible tubing
  - This tubing should also be ozone compatible as well

Date: 5/9/08
1.0 Purpose and Scope
   1.1 To safely shutdown and purge the ozone from the system

2.0 Responsibility
   2.1 The scientific personnel that carries out this procedure

3.0 Hazards and Safety Considerations
   3.1 Oxygen is toxic to humans and should be contained and destroyed effectively
   3.2 Oxygen can be combustible if in contact with organic materials, all parts are oxygen
       cleaned
   3.3 Oxygen analyzer should be used to ensure less than 23% is being released into the
       atmosphere

4.0 Equipment and Supplies
   - Oxygen tank
   - Nitrogen tank
   - Ozone Generator (Ozonia/CFS-1A)
   - Buffer tank (10gal pressure vessel)
   - Ozone Analyzer (IN USA/H1)
   - Ambient Ozone Analyzer (IN USA/IN2000L2-LC)
   - Anaerobic Reaction Tank (Schütt Labortechnik/stainless steel)
   - MnO2 Destruction tank
   - Humidity tank, excess water tank, and destruction tank (Ace Glass/500ml Gas washing
     bottle)
   - Stainless Steel piping (Valex 316L, Specification 301, ¼ in)
   - Ball Valves (Swagelok/SS-42GS4-SC11)
   - Needle Valves (Swagelok/SS-4MG-SL-SC11)
   - Pressure Release Valve (Swagelok/SS-RL3S4/SC11)
   - Pressure Gauge (Blue Ribbon Sales & Service Corp/BR4001-4LD, oxygen cleaned)
   - PVDF Tubing (McMaster-Carr/5390K342, 3-A sanitary tubing)
   - Butterfly Valve (McMaster-Carr/4682K74, ½ in connections)
   - Check Valve (Swagelok/SS-4C-1-SC11)
   - Rotameter (Mcmaster-Carr/8051K17)
   - Nylon Tubing (McMaster-Carr/5112K653, 3/8in OD)
   - Oxygen Detector (McMaster-Carr/18995T14)
5.0 Operational Procedure

5.1 Stopping Gas Flow

5.1.1 Turn off ozone generator by hitting the OFF command for POWER SUPPLY
5.1.1.1 Screen should indicate: PSU OFF and PURGING time
5.1.1.2 The background screen should also be orange
5.1.2 Allow for the equipment to purge the system with the feedgas and remove the residual ozone in the generator
5.1.3 Once this is completed the screen will turn green and read: PSU OFF and POWER 0000kw
5.1.4 Stop O₂ and water flow into the ozone generator
5.1.4.1 Close valves BV1 and turn off water supply
5.1.5 Close valve BV4 to stop flow into Anaerobic Reaction Tank
5.1.6 Open valves to allow for ozone destruction
5.1.6.1 Valves BV3, BV6
5.1.7 Allow ozone to flow into destruction tanks for predetermined time
5.1.7.1 Monitor oxygen analyzer to make sure O₂ concentration is less than 23%
5.1.8 Close valves BV3

5.2 Flushing the System

5.2.1 Open valves to allow for nitrogen flush of the system
5.2.1.1 BV 3-4, BV8-9 and NV3
5.2.2 Allow nitrogen to flush through the system for the specified time
5.2.3 Close all valves before the nitrogen tank
5.2.3.1 BV3-4, BV8-9, NV3
5.2.4 Open valves BV5 and set NV4 to remove humidity in the anaerobic reaction tank
5.2.5 Allow nitrogen to flush through the tank for a specified time
5.2.6 Close valves BV5-6 and NV4

6.0 References and Supporting Documents

Ozone Material Safety Data Sheet (MSDS).

Ozone Safe Working Practices. Work SafeBC.

Steiner, Ed. National Center for Food Safety and Technology Engineer.

1.0 Purpose and Scope
1.1 To safely startup the ozone system for delivery to the anaerobic reaction tank

2.0 Responsibility
2.1 The scientific personnel that carries out this procedure

3.0 Hazards and Safety Considerations
3.1 Ozone is toxic to humans and should be contained and destroyed effectively
3.2 Oxygen can be combustible if in contact with organic materials, all parts are oxygen cleaned
3.3 Oxygen analyzer should be used to ensure less than 23% is being released into the atmosphere

4.0 Equipment and Supplies
- Oxygen tank
- Nitrogen tank
- Ozone Generator (Ozonia/CFS-1A)
- Buffer tank (10gal pressure vessel)
- Ozone Analyzer (IN USA/H1)
- Ambient Ozone Analyzer (IN USA/IN2000L2-LC)
- Anaerobic Reaction Tank (Schütt Labortechnik/stainless steel)
- MnO2 Destruction tank
- Humidity tank, excess water tank, and destruction tank (Ace Glass/500ml Gas washing bottle)
- Stainless Steel piping (Valco 316L, Specification 301, ¼ in)
- Ball Valves (Swagelok/SS-42GS4-SC11)
- Needle Valves (Swagelok/SS-4MG-SL-SC11)
- Pressure Release Valve (Swagelok/SS-RL3S4/SC11)
- Pressure Gauge (Blue Ribbon Sales & Service Corp/BR4001-4LD, oxygen cleaned)
- PVDF Tubing (McMaster-Carr/5390K342, 3-A sanitary tubing)
- Butterfly Valve (McMaster-Carr/4682K74, ½ in connections)
- Check Valve (Swagelok/SS-4C-1-SC11)
- Rotameter (Mcmaster-Carr/8051K17)
- Nylon Tubing (McMaster-Carr/5112K653, 3/8in OD)
- Oxygen Detector (McMaster-Carr/18995T14)
5.0 Operational Procedure

5.1 Flushing the Anaerobic Reaction Tank
   5.1.1 Ensure all valves are closed
       a. PR 1-2, NV 1-4, BV 1-6, PRV 1-2
   5.1.2 Set valve NV2 to desired flow
   5.1.3 Set PR2 to 1.0 psig
   5.1.4 Open BV5 and BV6
   5.1.5 Allow nitrogen to flow through the Anaerobic Reaction Tank to flush any excess ozone into K1 destruction tank
   5.1.6 Close valves PR2, NV2, and BV5
   5.1.7 Close valve BV6

5.2 Setting Parameters for the Ozone Generator
   5.2.1 Turn water supply on
   5.2.2 Switch on (MAIN-ON) ozone generator and wait until the screen turns green
       a. Screen should read: MAINS ON→SYSTEM CHECK
   5.2.3 Select desired language (English, German, Latin, French, Italian, Spanish)
       a. Continually press SET POINT until desired language is displayed
   5.2.4 Wait 5 seconds to allow the ozone generator to set the language
   5.2.5 Ensure SET POINT is set to LOCAL
       a. Screen should read % LOCAL, PSU OFF
   5.2.6 Set valves for correct operating conditions
       a. PR1: 22psig
          a. NV1: 0.5 L/min
   5.2.7 Set generator to POWER SUPPLY ON
       a. Screen should read PSU ON
   5.2.8 Open valve BV1 and BV2
   5.2.9 Turn oxygen supply on
   5.2.10 Set gas flow by adjusting the HCV 301 dial located on the front of the generator

5.3 Achieving Desired Concentration
   5.3.1 Close valve BV2
   5.3.2 Open valve BV3 and BV7
   5.3.3 Allow ozone to flow through until desired concentration is achieved
       a. Refer to the H1 ozone analyzer reader in the system
   5.3.4 Set valve NV2
   5.3.5 Close valves BV8 and NV2
   5.3.6 Allow buffer tank pressure to reach 5psig
   5.3.7 Open valves BV4 and BV8, set valve NV3 and allow ozone to flow into the anaerobic tank for desired time

This document is uncontrolled when printed: 5/9/2008
For the most current and official copy, check the ...
5.3.8 Close valve BV3 once desired concentration is achieved
*Steps 5.3.7 and 5.3.8 should be done quickly and almost simultaneously

6.0 References and Supporting Documents

Ozone Material Safety Data Sheet (MSDS).

Ozone Safe Working Practices. WorkSafeBC.

Steiner, Ed. National Center for Food Safety and Technology Engineer.

Changes for Draft 7

- Additional line added connecting the nitrogen tank to the buffer tank
  - This will allow for flushing the system with nitrogen upon completion of the experiment
  - If ozone is left in the system it could possibly corrode the pipes over time and allow for humidity buildup in the system which would adversely affect the material and the experiment

- Addition of valves
  - BV7 – while obtaining the desired ozone concentration the ozone will need to flow only into the MnO₂ destruction tank. This valves will control the flow of the ozone into the buffer tank
  - BV 8 – stops and allows the flow of the ozone from the buffer tank
  - BV9 and NV5 – controls the flow of the nitrogen for flushing the system

- Additional line connecting to the MnO₂ destruction column
  - Safety measure to make sure the ozone does not backflow into the generator or ozone analyzer
Conference Call w/Air-Liquide Notes
Date: May 14, 2008

Absents
Vasuhi Rasanayagam
Ted Rekart

Attendees
Claudia Rodriguez
Kerri Cooper
Dr. Peter Slade
Ed Steiner

Discussion
- Need to finalize dates for training → June 2nd or 3rd
- Email Vasuhi and ask for comments on SOPs
- June 3rd best day for training
  → will be all day training
  → what equipment is needed for training
- Pilot plant spot
  → steel toe covers (contact Todd)
  → wear hard hat
- Obtain wire cutter and bender from Ed Steiner
- Electrical parts for setting up the system in Lab 105
  → will discuss with Ed what is needed

To Do List
1. Email Vasuhi
   → SOP comments
   → training date
   → equipment for training
2. Contact Todd concerning steel toe covers

Kevin C. C. 5/14/08
Conference Call w/ Air-Liquide Notes
May 19, 2008

Attendees
Kerri Cooper
Dr. Peter Slade
Ed Steiner
Vasuki Rasanayagam
Ted Rekart

Discussion
- combine shutdown and startup procedure
- add flowmeters into system for setting needle valves
- add procedure for setting needle valves
- verify flush time with ambient analyzer
- Vasuki has shipped O2 cleaned parts
  → ferrule will be sent at the end of week
  → destruct column contains MnO2 already
- Training: June 2 & 3rd
  → HAZOP will require 1 day
  → Dr. Slade will send list of other trainings he would like to have
  → Vasuki will email a list of items she will need for training
- Ted reminded me of safe handling of O2 cleaned parts
  → don’t leave out in atmosphere
  → no oil or grease to be used
  → will send list of O2 compatible lubricants

To Do List
- update SOPs - discuss with Dr. Slade + Ed
- update P+ID
- email information to Air-Liquide

Keri C. Cooper 5/19/08
Meeting with Todd Diehl
- Safety Officer Introduction
Date: 5/27/08

Submissions for Committee
- SOP → approval form
- R+ID
- map
- attachments
  → HAZOP
- operational SOP (PPE, hazards, chemicals)★ - reference startup & shutdown SOP
  - lab workers
  - leakage

Training - June 2 & 3, 2008
  - cylinder
  - O2 cleaning
  → Dr. Stade will contact Vasuhi for materials list

1 wk for review after submission

Attendees
  Kerri Cooper
  Dr. Peter Stade
  Ed Steiner
  Todd Diehl

Ken C. Cooper 5/27/08
1. Curtains for drawing O₂ through hood
2. Fan turned on/ off
3. All components O₂ cleaned
4. PPE requirements
5. Lab access during experimentation
6. Monitor ambient analyzer → inhalation limits (OSHA)
7. Leak test → run N₂ through initially
8. Contingency procedures - what happens if leak occurs
9. Emergency Contacts
   → Dr. Slade
   → Ed Steiner
   → Kerri Cooper
10. Training
11. Handling O₂ cleaned parts
12. Chemical handling
    → disposal
    → interactions
Training with Air Liquide

June 2, 2008

I. Cylinder Handling (presented by Ted Rekert)
   - Safe Storage, Handling & Use of Compressed Gas
     - 3 types of gases
       1. compressed
       2. liquefied
       3. dissolved (acetylene)
     - 3 classes of gases
       1. flammable (acetylene, H₂, propane, butane)
       2. non-flammable (N₂, argon, He, Air, CO₂, O₂)
       3. poison gas (toxic & corrosive)
   A. Cylinder Use
      - know which gas you’re using
      - never use an adapter to make a cylinder fit a regulator
        → CGA stamp should match
      - open valve slowly!
      - leak check w/ soapy solution
        → NEVER use flame!
      - close valves when not in use
      - OSHA most cited violations
        → O₂ & flammable gases too close
   B. Cylinder Storage
      - storage based upon:
        → types of gases
        → full/empty cylinders
      - secure cylinder before removing valve
      - store in well ventilated areas (< 125°F)
      - keep away from electrical circuits
      - avoid excessive moisture

Nam C. Giv 6/9/08
Training with Air Liquide

C. Cylinder Handling
   - do not roll or drag cylinders
   - use hand truck to move cylinders
   - keep valve protection caps in place while in storage, during handling, and transportation

D. Special Precautions for Flammable Gas
   - no smoking near cylinder
   - use spark proof tools
   - flammable gases should be stored 20 ft away from:
     - oxidizers
     - combustibles
     - ignition sources
   - Oxygen
     * keep away from oil & grease

E. Summary
   - never use a gas unless you are trained in its use & understand the hazards
   - use MSDS

II. Oxygen Cleaning (presented by Ted Rekort)
   - levels 1 & 2

A. Scope
   - list cleaning agents

B. HSE considerations
   - hydrocarbon contamination in presence of O₂ → explosion, fire, serious injuries
     - handle with clean cotton white gloves
     - could occur at any time
   - entry into any confined space for inspection, cleaning shall require a Confined Space Entry Permit
   - O₂ concentrations below 19.5% by vol. reduce the capacity to sustain life

Roni C. Cook 6/9/08
Training w/ Air-Liquide

- solvent or cleaner spill emergencies
  - notify management immediately
  - refer to MSDS

B. Terminology
- a component or system: any component or system that contains O2 at a conc. of 23.5% or greater
- qualified person
- aqueous cleaner: chemical composition containing any of the following
  - diluted to a specified conc. w/ potable H2O
- solvent: chemical not miscible in water & does not require dilution
- contaminants: loosely adherent rust, dirt, grit, grinding dust, metal filings
- preliminary cleaning: used to remove large units of particles
- O2 Service + O1.5 + greases
- greases + oils must be compatible w/ service equipment

D. Air-Liquide Policy
- Level 1 - cleaned for O2 service + oxidizing gases + mixtures
  - cleaning solutions + solvents

E. Packaging - Recommendations
- protect & labeled as such O2 cleaned immediately to prevent contamination
- should not be in a resellable package
- labeling - do not use duct tape
- if bag is broken must reclean item

F. Storage
- all components must be separated from dirty or uncleaned items

G. Documentation
- cleaning + inspection check sheet
- can use checklist to inspect incoming items

H. Level 1 + 2 Cleaning Solution
- Blue Gold

6/9/08
I. Cleaning Techniques
   - hand wiping
   - scrubbing
   - immersion cleaning
   - ultrasonic cleaning
   - flushing
   - hand tool cleaning
   - power tool cleaning
   - brushes w/ steel bristles are only permitted for use on carbon steel

J. Preliminary Cleaning Methods
   - steam
   - white-blast cleaning

K. Minimum inspection
   - odor test + visual inspection
   - odor test + wipe test
   * only qualified persons

III. Oxygen Enrichment (given by Ted Rekort)
   A. Properties of O₂
      - normal conc. in air is 21%
      - can breathe 50-60% O₂ enriched atmosphere for several hrs
        ➞ dangerous to do without knowing associated risk
      - not flammable but supports combustion
        ➞ materials burn fiercely
      - concentrations above 23% in air the situation becomes dangerous
      - colorless, odorless & tasteless
      - heavier than air ➞ goes to low lying areas
      - 3 elements needed for explosion
        ➞ O₂, combustible material, ignition sources

Kerri C. Coger 6/9/08
Training w/ Air-Liquide

- never use oil or grease to lubricate O2 equipment
- leaking equipment is very dangerous
  - perform a leak check before operation
- be careful using O2: only in system
  -  O2 only in system
- no flames in area
- risk areas for atmosphere
  - low enclosed areas
  - around tank filling
  - closed rooms, insufficient ventilated areas
- no work before checking atmosphere
- in case of entry in enriched atmosphere
  - ventilate clothing in open air for at least 15min before smoking or going near ignition source

B. Temperature effect

C. Adiabatic compression effect
  - opening a valve, gas downstream is quickly compressed
  - use validated compression effect, explosion of a press. gauge

D. Flow friction effect
  - velocity of gas

IV. Ozone Safety (presented by Ted Rekart)

A. Advantages
  - not stored in bulk
  - generator shutdown eliminates supply of ozone
  - not explosive or flammable

B. Important concepts
  - automatic warning, can smell before harm
  - effects of exposure are a function of time and conc.
Training w/ Air Liquide

- First aid
  - low level - fresh air
  - high levels - seek medical care

C. Reactions to Exposure
- irritating to eyes, throat, nose, upper respiratory tract & lungs
- headaches, nausea, wheezing, or coughing
- pulmonary edema
- no evidence will cause cancer or harm to unborn
- check w/ doctor if you have special respiratory or heart conditions

- discharge according to OSHA
  - check requirements
  - record discharge conc. according to analyzer

Line: HA

[Signature]
6/9/08
HAZOP Training with Air-Liquide
June 2, 2008

Attendees
- Kerri Cooper
- Vasuki
- Ted Rekort
- Steve Fisher
- Lei Wang
- Bharat Aluri
- Todd Diel
- Peter Slade
- Ed Steiner

- Risk matrix used to determine severity

Notes
1. Between O2 cylinder and O3 generator
   - add PRV to outside building
   - valve misalignment: dial reset inappropriately while not being attended
   - SOP for checking O2 cylinder volume
   - SOP for removing O2 line
   - look at dew pt. temp vs cooling H2O temp

2. Ozone humidification line
   - everything between BV7 + BV4 (except Na lines + MnO2 column)
   - mini operating procedure: complete purge w/ ambient analyzer
   - SOP for checking concentration
   - channeling through MnO2, agglomeration of powder and causing O2 not to come in contact with the powder and destroy
   - in startup SOP check MnO2 reaction

Muni C. Cooper 6/9/08
3. Node 3: MnO2 destruct column
   - check efflcy of column routinely (startup SOP)
   - monitor % exit temp.
   - column pressure
4. Node: Ozone Analyzer
   - add flow meter to P+ID (black box)
   - make sure SOP includes setting appropriate flow

5. Nitrogen Supply
   - initial valve alignment
   - check press of tank (50psi)
   - verify N₂ amount during purge -> flow meter + ambient analyzer
   - need check valve coming out of generator to avoid backflow into N₂
   - No oil N₂ needed

6. Anaerobic Tank + KI destruction
   - glass wool at outlet to capture KI
   - SOP for checking KI strength
   - pre-rinse -> check all tanks before beginning
   - SO1  4°C

7. Fume Hood
   - SOP in case of hood failure -> turn off cylinders
   - calculate O₂ percentage with full release
   \[ L = \frac{150}{49} \]
1. Anaerobic Tank Volume

\[ V = \pi \left( \frac{117\text{mm}}{2} \right)^2 (270\text{mm}) \]
\[ V = 2.9 \times 10^6 \text{mm}^3 \]
\[ V = 2.9 \text{L} \]

2. Maximum flow rate of O₃ released from generator

\[ 0.96 \text{cm}^3/\text{hr} \times \frac{1000 \text{L}}{\text{m}^3} \times \frac{1 \text{hr}}{60 \text{min}} = 16 \]

Max flow rate = 16 L/min

3. Cooling medium pressure for O₃ generator (max press)

- 6 bar \times \frac{1.43 \text{bar}}{\text{bar}} = 8.6 \text{ bar} \]
- 8.6 bar \times \frac{145 \text{psi}}{1 \text{bar}} = 125.7 \text{ psi} \approx 124.7 \text{ psi} \]

\[ 124.7 \text{ psi} \approx 124.7 \text{ psi}_{\text{g}} \]

4. Volume of Buffer tank

\[ 10 \text{ gal} \times \frac{3.79 \text{ L}}{1 \text{ gal}} = 37.9 \text{ L} \]

5. Required time to flush Anaerobic tank

\[ t = \frac{V}{Q} \]
\[ t = \frac{2.9 \text{L}}{16 \text{L/min}} = 0.18125 \text{ min} = 10.9 \text{ secs} \]
OZONE DESIGN SYSTEM

Diagram showing components and flow of ozone generation and treatment.
Changes from Draft 8

- Recalculate flows and pressures
- Addition of PRV between the O2 cylinder and the O3 generator
  o This prevents too high pressure of oxygen from flowing into the ozone generator
  o A safety measure in case the pressure regulator fails or is misaligned
- Addition of valves
  o CV2 – check valve prevents backflow of ozone into the generator which could cause over pressurizing
  o BV11 – allows for ozone to flow freely into the humidity tank without being routed to the MnO2 destruct column after the correct concentration has been established
  o BV10 – closes off the line to the humidity tank while the ozone concentration is being achieved and stabilized
  o Flow meters – reference for setting the needle valves for a particular flow
- Changed the direction of the arrow of the connection between the Anaerobic Reaction Tank and the KI Destruction Tank to flowing into the destruction tank
- Moved the line connecting the nitrogen tank to the buffer tank so that it is connected after PR2
Changes from Draft 9, Version 1

- Added in references for the ozone generator and ozone analyzer (H1) P&IDs
- Changed PRV 2 pressure rating
  - Miscalculation of the Anaerobic Reaction Tank maximum pressure
  - 0.2 bar = 2.9 psi
  - Pressure set to release at 2.5 for safety aspects
- Changed sizes of text for easier reading
HI Series Ozone Analyzer P&ID

Flow Meter (FM)
Pressure Transducer (PT)
Cell (C)

Gas Outlet

Gas Inlet
Changes from Draft 9, Version 2

- Changed pressure of cooling water entering the ozone generator
  - There is an actual range that the generator can withstand
  - 38-82 psi

- Added in material change leading into the KI tank
  - Stainless steel is connected between the anaerobic reaction tank and valve BV6
  - PVDF connects BV6 to the KI tank
Changes from Draft 9, Version 3

- Oxygen tank exit pressure
  - Changed to 50psi due to the range rated for the ozone generator. The middle pressure was chosen for safety aspects

- Cooling water inlet pressure
  - Changed the pressure to 45psi to prevent overpressurization of the gauge and the generator

- Exit pressure from the ozone generator
  - Changed pressure to 10psi to prevent blowing PR1 which is set to 12.5

- Pressure of exit gas from the buffer tank
  - Changed to 5psi to prevent overpressurizing the gas washing bottles and causing the stoppers to pop open

- Inlet pressure of nitrogen tanks
  - 25psi for lines flowing into the buffer tank
  - 10psi for purge line into the anaerobic reaction tank
Changes from Draft 10

- Added an extra KI Destruction Task
  - This will help destroy more ozone without depleting the solution too fast
1.0 Purpose and Scope
   1.1 To safely startup and shutdown the ozone system for delivery and destruction to the anaerobic reaction tank

2.0 Responsibility
   2.1 The scientific personnel that carries out this procedure

3.0 Hazards and Safety Considerations
   3.1 Ozone is toxic to humans and should be contained and destroyed effectively
   3.2 Oxygen can be combustible if in contact with organic materials, all parts are oxygen cleaned
   3.3 Oxygen analyzer should be used to ensure less than 23% is being released into the atmosphere

4.0 Equipment and Supplies
   - Oxygen tank
   - Nitrogen tank
   - Ozone Generator (Ozonia/CFS-1A)
   - Buffer tank (10gal pressure vessel)
   - Ozone Analyzer (IN USA/H1)
   - Ambient Ozone Analyzer (IN USA/IN2000L2-LC)
   - Anaerobic Reaction Tank (Schütt Labortechnik/stainless steel)
   - MnO2 Destruction tank
   - Humidity tank, excess water tank, and destruction tank (Ace Glass/500ml Gas washing bottle)
   - Stainless Steel piping (Valex 316L, Specification 301, ¼ in)
   - Ball Valves (Swagelok/SS-42GS4-SC11)
   - Needle Valves (Swagelok/SS-4MG-SL-SC11)
   - Pressure Release Valve (Swagelok/SS-RL3S4/SC11)
   - Pressure Gauge (Blue Ribbon Sales & Service Corp/BR4001-4L.D, oxygen cleaned)
   - PVDF Tubing (McMaster-Carr/5390K342, 3-A sanitary tubing)
   - Butterfly Valve (McMaster-Carr/4682K74, ½ in connections)
   - Check Valve (Swagelok/SS-4C-1-SC11)
   - Flowmeter (McMaster-Carr/8051K17)
   - Nylon Tubing (McMaster-Carr/5112K653, 3/8in OD)
   - Oxygen Detector (McMaster-Carr/18995T14)
   - Vancometer

This document is uncontrolled when printed: 4/3/2009
For the most current and official copy, check the...
5.0 Operational Parameters
- Humidity tank volume: 250ml
- KI Destruction Tank volume: 300mL KI solution (40g/L)
  - 12g KI / 250ml H₂O

6.0 Operational Procedure
6.1 Turn on the following:
  6.1.1 Fume Hood
    a. Refer to vaneometer to ensure that air is flowing upward into the fume hood
  6.1.2 Ambient ozone analyzer
  6.1.3 In-line ozone analyzer

6.2 Ensure needle valves are set correctly according to SOP: MC-SA-SOP005-V01

6.3 Calculating the Volume of Gas in the O₂ and N₂ Cylinders
  6.3.1 Determine pressure within the cylinder by referring to the gauge connected to
        the cylinder
  6.3.2 Calculate the volume of the cylinder using this ratio by solving for x:

\[
\frac{2600 \text{ psi}}{300 \text{ ft}^3} = \frac{\text{gauge pressure (psi)}}{x \text{ ft}^3}
\]

6.3.3 Record the gas cylinder volumes in the log book located in Lab 105
6.3.4 If volume is not sufficient for experimental run then refer to the
        disconnecting O₂ and N₂ cylinders SOP (MC-SA-105-SOP003-V01)

*This should be done before every experimental run

6.4 Flushing the Anaerobic Reaction Tank
  6.4.1 Ensure the following valves are closed
    a. PR 1-2 and BV 1-11
  6.4.2 Open BV6
  6.4.3 Open BV5
    a. Switch the orange lever to the open position
  6.4.4 Set PR2 to 10 psi
    a. Flow rate: 5 L/min
  6.4.5 Allow nitrogen to flow through the Anaerobic Reaction Tank into the KI
        Destruction Tank
  6.4.6 Verify flush time with ambient ozone analyzer by placing tubing
        perpendicular to the exit port of the KI Destruction Tank
    a. Ozone concentration should be zero
  6.4.7 Stop nitrogen flow by setting PR2 to zero

This document is uncontrolled when printed: 4/3/2009
For the most current and official copy, check the ...
6.4.8 Close valve BV5
   a. Switch the orange lever to the shut position
6.4.9 Close valve BV6

6.5 Setting Parameters for the Ozone Generator
6.5.1 Turn water supply on
   a. Constraints:
      • Flow: 1.5 L/min
      • Pressure: not to exceed 50psi
      • Butterfly valve open to 40°
6.5.2 Switch on (MAIN-ON) ozone generator and wait until the screen turns green
   a. Screen should read: MAINS ON → SYSTEM CHECK
6.5.3 Select desired language (English, German, Latin, French, Italian, Spanish)
   a. Continually press SET POINT until desired language is displayed
6.5.4 Wait 5 seconds to allow the ozone generator to set the language
6.5.5 Ensure SET POINT is set to LOCAL
   a. Screen should read 0% LOCAL, PSU OFF
6.5.6 Open oxygen cylinder
6.5.7 Set PR1 to 50psi by turning the regulator knob
6.5.8 Open valves (located under table)
   a. BV2
   b. BV1
6.5.9 Set pressure on the generator to 1.5bar using the PCV 201 dial
   a. Refer to P1 201 pressure gauge
6.5.10 Turn power supply on by switching PSU ON (located on ozone generator)
   a. Screen should read PSU ON
6.5.11 Set gas flow by adjusting the HCV 201 dial located on the front of the generator
6.5.12 Adjust pressure and gas flow to desired parameters
6.5.13 Increase %PSU by pressing the SET POINT button.

6.6 Checking MnO₂ Effectiveness
6.6.1 Ensure BV2 is open
6.6.2 Follow ozone generator startup procedure
6.6.3 Place tubing connected to the ambient ozone analyzer (Model IN2000L2-LC)
   perpendicular to flow to the exit port of the MnO₂ destruction column
   a. The analyzer should read 0.05ppm or less
6.6.4 Record concentration in the log book
6.6.5 Using temperature probe determine temperature of the gas at the exit port
   a. Do not touch column – it may be hot
6.6.6 Record information in the log book
6.6.7 If concentration exceeds 0.05ppm immediately switch ozone generator MAINS OFF. If the concentration is below 0.05ppm continue with the following steps
  a. DO NOT OPEN COLUMN \( \rightarrow \) MnO\(_2\) requires special handling
     6.6.7.1 Notify Ed Steiner (NCFST Director of Facilities and Pilot Plant) and Vaushi Rasanyagam (Air-Liquide)
  6.6.8 Open BV7 and allow ozone to flow into the Buffer Tank
  6.6.9 Close BV2
  6.6.10 Pressurize tank to 5 psi
  6.6.11 Open BV2
  6.6.12 Close BV7

6.7 Checking KI Destruct Tank Effectiveness
  6.7.1 Open BV6
  6.7.2 Open BV4
  6.7.3 Open BV10
  6.7.4 Open BV8
  6.7.5 Allow ozone to flow through the KI Destruction Tank
  6.7.6 Place tubing connected to the ambient ozone analyzer (Model IN2000L2-LC) at the exit port of the KI destruction tank
     a. The analyzer should read 0.05ppm
  6.7.7 Close BV8
  6.7.8 Close BV10
  6.7.9 Close BV4
  6.7.10 Close BV6
  6.7.11 Record effluent ozone concentration in log book
  6.7.12 If ozone limits exceed 0.05ppm follow the next steps otherwise skip to step 6.7.18
  6.7.13 Remove KI Destruction Tank from the system
  6.7.14 Dispose of the KI according to safety procedures
  6.7.15 Refill with new KI solution
  6.7.16 Reattach KI Destruction Tank to system
  6.7.17 Follow the Flushing the Anaerobic Reaction Tank procedure

6.8 Achieving Desired Concentration
  6.8.1 Open BV3
  6.8.2 Open BV11
  6.8.3 Open BV8
  6.8.4 Open BV7
  6.8.5 Close BV2
6.8.6 Allow ozone to flow through the H1 analyzer at 0.5L/min until desired concentration is achieved
   a. Adjust %PSU and flow rates as needed
   b. Monitor the flow rate on the analyzer to ensure it is exactly 0.5L/min. You may have to adjust NV2 and BV3
   c. Monitor G1 on the buffer tank to make sure it remains zero
6.8.7 Close valve BV8
6.8.8 Close valve BV11
6.8.9 Close valve BV3
6.8.10 Pressurize buffer tank to 5psi
   a. Refer to G1
6.8.11 Open valve BV2
6.8.12 Close valve BV7

6.9 Stopping Gas Flow
6.9.1 Reduce power supply to 0% LOCAL by pressing the down button for SET POINT
6.9.2 Turn off ozone generator power supply by switching to PSU OFF
   a. Screen should indicate: PSU OFF and PURGING time
   b. The screen background should be orange
6.9.3 Allow for the equipment to purge the system with the feedgas and remove the residual ozone in the generator
   a. This process runs for 90s
6.9.4 Once this is completed the screen will turn green and read: PSU OFF and POWER 00000Kw
6.9.5 Set ozone generator pressure to zero
   a. Adjust by turning PCV 201 dial
6.9.6 Stop oxygen flow into the ozone generator
   a. Set PR1 to zero
   b. Close valve BV1
6.9.7 Close valve BV2

6.10 Experimental Run
6.10.1 Once desired concentration is achieved open valve BV6
6.10.2 Open valve BV4
6.10.3 Open valve BV10
6.10.4 Open valve BV8
6.10.5 Allow ozone to flow through the anaerobic tank
6.10.6 Close valve BV6
6.10.7 Pressurize anaerobic tank to 1.4psi (0.1bar)
   a. Refer to G2
6.10.8 Close valve BV8
6.10.9 Close valve BV10
6.10.10 Close valve BV4
6.10.11 Perform experimental run
6.10.12 Refer to Step 6.4 for flushing the Anacrobic Reaction Tank
6.10.13 Remove samples replace lid securely

6.11 Flushing the System
6.11.1 Open valves
   a. BV3
   b. BV8
6.11.2 Depressurize buffer tank by allowing the ozone to flow out of the tank
   a. G1 should read 0psi before continuing
6.11.3 Set PR2 to 25psi
6.11.4 Open valves
   a. BV11
   b. BV9
6.11.5 Allow nitrogen to flush through the system
6.11.6 Monitor the H1 in-line analyzer until the %wt reads 0%
6.11.7 Close valves
   a. BV8
   b. BV11
   c. BV3
6.11.8 Pressurize buffer tank to 10psi
6.11.9 Close BV9
6.11.10 Open valves (in the following order)
   a. BV6
   b. BV4
   c. BV10
   d. BV8
6.11.11 Allow nitrogen to flush through system
   a. Monitor ozone concentration released from the KI column using the
      ambient ozone analyzer ensuring that it does not exceed 0.05ppm
   b. If the concentration does not exceeds 0.05ppm continue with Step 6.11.17
6.11.12 If concentration exceeds 0.05ppm immediately close the following valves:
   a. BV8
   b. BV10
   c. BV4
   d. BV6
6.11.13 Remove both KI destruct columns from the system
6.11.14 Transfer the KI waste into the designated waste container
6.11.15 Fill the bottles with new KI solution and then continue with Step 6.11.18
6.11.16 Open BV3
6.11.17 Close valves (in the following order)
   a. BV10
   b. BV4
6.11.18 Allow remainder of nitrogen to flow out of tank
   a. Make sure G1 reads 0psi
6.11.19 Close
   a. BV8
   b. BV3
6.11.20 Set PR2 to 10psi
   a. Flow rate: 5 L/min
6.11.21 Open valve BV5 to remove humidity in the anaerobic reaction tank
   a. Switch orange lever to open
6.11.22 Allow nitrogen to flush through the tank for at least 1.5min
6.11.23 Set PR2 to zero
6.11.24 Close valve BV5
   a. Switch orange lever to shut position
6.11.25 Allow Anaerobic Reaction Tank pressure to reach 0psi
   a. Refer to G2
6.11.26 Close valve BV6

6.12 If performing another experimental run return to Step 6.5.5. If the experimentation is done for the day, continue with step 6.13

6.13 Shut Down Procedure (once all experimental runs are completed)
6.13.1 Switch MAINS OFF
6.13.2 Turn off water supply
   a. Close butterfly valve
6.13.3 Close gas cylinders by turning the valve
   a. Nitrogen
   b. Oxygen
6.13.4 Turn off analyzers
   a. HI (in-line)
   a. Ambient analyzer
6.13.5 Turn off fume hood

Potassium Iodide (KI) Material Safety Data Sheet (MSDS).

Steiner, Ed. National Center for Food Safety and Technology: Director of Facilities and Pilot Plant.

1.0 Purpose and Scope

1.1 To safely shutdown the ozone system in a timely fashion if procedure limits or equipment fails.

2.0 Responsibility

2.1 The scientific personnel that carries out this procedure

3.0 Hazards and Safety Considerations

3.1 Ozone is toxic to humans and should be contained and destroyed effectively
3.2 Oxygen can be combustible if in contact with organic materials, all parts are oxygen cleaned
3.3 Oxygen analyzer should be used to ensure less than 23% is being released into the atmosphere
3.4 Release of nitrogen into the atmosphere can reduce the level of oxygen causing potential suffocation

4.0 Equipment and Supplies

- Oxygen tank
- Nitrogen tank
- Ozone Generator (Ozonia/CFS-1A)
- Buffer tank (10gal pressure vessel)
- Ozone Analyzer (IN USA/H11)
- Ambient Ozone Analyzer (IN USA/IN2000L2-LC)
- Anaerobic Reaction Tank (Schütt Laborteknik/stainless steel)
- MnO₂ Destruction tank
- Humidity tank, excess water tank, and destruction tank (Ace Glass/500ml Gas washing bottle)
- Stainless Steel piping (Valex 316L, Specification 301, ⅛ in)
- Ball Valves (Swagelok/SS-42GS4-SC11)
- Needle Valves (Swagelok/SS-4MG-SL-SC11)
- Pressure Release Valve (Swagelok/SS-RL354/SC11)
- Pressure Gauge (Blue Ribbon Sales & Service Corp/BR4001-4LD, oxygen cleaned)
- PVDF Tubing (McMaster-Carr/5390K342, 3-A sanitary tubing)
- Butterfly Valve (McMaster-Carr/4682K74, ¼ in connections)
- Check Valve (Swagelok/SS-4C-1-SC11)
- Rotameter (McMaster-Carr/8051K17)
- Nylon Tubing (McMaster-Carr/5112K653, 3/8in OD)
- Oxygen Detector (McMaster-Carr/18995T14)
- Cotton/Polyester Blend Knit Gloves (McMaster-Carr/6078T53)
- Vaneometer

5.0 Responsible Personnel

- Kerri Cooper: Ozone System Engineer (Student) 803-669-3737
- Ed Steiner: Director of Facilities and Pilot Plant 708-308-8911
- Dr. Peter Slade: Project Instructor 708-563-8172
6.0 Operational Procedure

6.1 Fume Hood Failure (due to mechanical or power failure)
   6.1.1 Refer to vaneometer to determine if air is flowing in the direction of fume hood draw and
   use sound for indication of failure
   6.1.2 Check efficacy of the KI destruction tank and the MnO<sub>2</sub> destruct column
       a. If ozone's limits are less than 0.1ppm and oxygen detector is within the range of 20-
          21% continue experiment but monitor levels
       b. If limits are not within range continue to step 6.1.3
   6.1.3 Do emergency shutdown of the ozone generator by switching MAINS to OFF
       a. This will skip the generator purge step (do not allow system to purge)
   6.1.4 Close valves BV2, BV3, and BV6
   6.1.5 Close N<sub>2</sub> and O<sub>2</sub> cylinders if they are open
   6.1.6 Set PR1-2 to zero
   6.1.7 Evacuate room and close door
   6.1.8 Post note on door warning individuals not to enter room
   6.1.9 Contact responsible personnel

6.2 Oxygen Leak or High Concentrations of 23% or greater (refer to oxygen detector)
   6.2.1 Ensure fume hood is running
       a. Refer to vaneometer
   6.2.2 Perform emergency shutdown of ozone generator by switching MAINS to OFF
   6.2.3 Set PR1 to zero
   6.2.4 Close O<sub>2</sub> and N<sub>2</sub> cylinders
   6.2.5 Close valves BV2, BV3, BV10 and BV6
   6.2.6 Evacuate room
   6.2.7 Post note on door warning individuals not to enter room
   6.2.8 Contact responsible personnel

6.3 Ozone Leak or Release of High Concentrations
   6.3.1 Ensure fume hood is running
       a. Refer to vaneometer
   6.3.2 Refer to O<sub>3</sub> analyzer Model: IN2000L2-LC
       a. If concentration is less than 0.1ppm perform leak test and check KI destruction tank and
          MnO<sub>2</sub> exhaust
       b. If concentration is 0.1ppm or greater continue with emergency shutdown
   6.3.3 Perform emergency shutdown of ozone generator by switching MAINS to OFF
   6.3.4 Close valves BV2, BV3, BV10 and BV6
   6.3.5 Close O<sub>2</sub> and N<sub>2</sub> cylinders
   6.3.6 Evacuate room and close door
6.3.7 Post note on door warning individuals not to enter room
6.3.8 Contact responsible personnel

6.4 Nitrogen Release into Atmosphere (refer to O₂ analyzer)
6.4.1 Ensure fume hood is running
6.4.2 Refer to oxygen analyzer to determine percentage of O₂ in atmosphere
  a. Oxygen level should not fall below 19.5%
6.4.3 Perform emergency shutdown of ozone generator by switching MAINS to OFF
6.4.4 Close O₂ and N₂ cylinder
6.4.5 Close valves BV2, BV3, BV10 and BV6
6.4.6 Evacuate room and close door
6.4.7 Post note on door warning individuals not to enter room
6.4.8 Contact responsible personnel

6.5. Determining percent oxygen in the atmosphere after a nitrogen release
\[
\%O_2 = \frac{V_o}{V_r} \times 100 \quad \text{where,}
\]
\[
V_r = \text{room volume}
\]
\[
V_o = \text{max gas release (cylinder volume)}
\]
\[
V_o = 0.2095 \times (V_r - V_g)
\]

6.5.1 Worst Case Scenario for the Release of the Maximum Volume of the N₂ Cylinder into Laboratory 105 - NCFST

\[
\%O_2 = \frac{V_o}{V_r} \times 100
\]
\[
\%O_2 = \frac{0.2095 \times (2457 \text{ ft}^3 - 300 \text{ ft}^3)}{2457 \text{ ft}^3}
\]
\[
\%O_2 = 18.4\%
\]

7.0 References and Supporting Documents

Ozone Design System P&ID

1.0 Purpose and Scope
   1.1 To safely disconnect the oxygen and nitrogen cylinders from the system

2.0 Responsibility
   2.1 The scientific personnel that carries out this procedure

3.0 Hazards and Safety Considerations
   3.1 Incorrect removal could cause release of ozone, oxygen, or nitrogen into the atmosphere
   3.2 Ozone is toxic to humans and should be contained and destroyed effectively
   3.3 Oxygen can be combustible if in contact with organic materials, all parts are oxygen cleaned
   3.4 Oxygen analyzer should be used to ensure less than 23% is being released into the atmosphere
   3.5 Inappropriate disconnection of the cylinders can cause over pressurization of the system causing gas leaks or system failure

4.0 Equipment and Supplies
   • Oxygen tank
   • Nitrogen tank
   • Ozone Generator (Ozonia/CFS-1A)
   • Ambient Ozone Analyzer (IN USA/IN2000L2-LC)
   • Stainless Steel piping (Valex 316L, Specification 301, ¼ in)
   • Ball Valves (Swagelok/SS-42GS4-SC11)
   • Needle Valves (Swagelok/SS-4MG-SL-SC11)
   • Pressure Release Valve (Swagelok/SS-RL3S4/SC11)
   • Butterfly Valve (McMaster-Carr/4682K74, ½ in connections)
   • Rotometer (Mcmaster-Carr/8051K17)
   • Nylon Tubing (McMaster-Carr/5112K653, 3/8in OD)
   • Oxygen Detector (McMaster-Carr/18995T14)
   • Cotton/Polyester Blend Knit Gloves (McMaster-Carr/6078T53)
   • Vaneometer

5.0 Operational Procedure
   5.1 Turn on Fume Hood
       5.1.1 Refer to vaneometer to ensure that air is flowing upward into the fume hood
5.2 Oxygen Cylinder Disconnection

5.2.1 Ensure the ozone generator is not running
5.2.2 Check valves to ensure they are closed
   a. BV1 – 11
5.2.3 Close O₂ cylinder valve
5.2.4 Ensure PR1 is set to zero
5.2.5 Disconnect O₂ cylinder from system
   a. Monitor O₂ detector to ensure high concentrations of oxygen is not being released
5.2.6 Reconnect new cylinder to system
5.2.7 Check connections for any leaks using the leak detector

5.3 Nitrogen Cylinder Disconnection

5.3.1 Ensure all valves are closed
   a. BV1 – 11
5.3.2 Close N₂ cylinder valve
5.3.3 Ensure PR2 is set to zero
5.3.4 Disconnect the N₂ cylinder from the system
5.3.5 Reconnect new cylinder to system
5.3.6 Check connections for any leaks using the leak detector

*Note: this procedure should not be done while any pieces of the equipment are running or in use. Cylinders should be disconnected before or after experimental runs.

This document is uncontrolled when printed: 4/3/2009  
For the most current and official copy, check the ...
5.0 Operational Procedure

5.1 Turn on Fume Hood
   5.1.1 Refer to vanometer to ensure that air is flowing upward into the fume hood

5.2 Refer to SOP: MC-SA-105-SOP001-V01 for starting up the ozone generator

5.3 Setting Valve Flow (these valves should not have to be adjusted once the design is setup unless flow begins to vary)

5.3.1 For NV1
   a. Open valve BV1
   b. Open valve BV2
   c. Set NV1 by referring to the flow meter on the ozone generator. Flow should be 21 L/min
   d. Close valve BV1
   e. Close BV2

5.3.2 For NV2 and NV3
   a. Open BV7
   b. Open BV1
   c. Pressurize buffer tank to 5 psi
   d. Close BV7
   e. Open BV2
   f. Open valve BV3
   g. Open valve BV11
   h. Open valve BV8
   i. Adjust NV2 to 0.5 L/min by referring to the ozone analyzer’s flow meter
   j. Close BV8
   k. Close BV11
   l. Close BV3
   m. Open BV7
   n. Pressurize buffer tank to 5 psi
   o. Close BV7
   p. Open BV6
   q. Open BV4
   r. Open BV10
   s. Adjust NV3 by referring to the flow meter located upstream of the valve

   5.3.2.1 Set flow to 15 (3.51 L/min)
   5.3.2.2 The water contained in the humidity tank should not splash excessively. If this occurs reduce the flow.

An example step by step

The results of an analysis can be summarized in a table, where steps are listed in columns. Deviations of a node are investigated in rows.

<table>
<thead>
<tr>
<th>Node</th>
<th>Function</th>
<th>Deviation</th>
<th>Causes</th>
<th>Effects</th>
<th>Means of reduction</th>
<th>L</th>
<th>S</th>
<th>C</th>
<th>Action</th>
<th>Comment</th>
<th>Ref</th>
</tr>
</thead>
</table>

Table 1: HAZOP table

The columns contain the following information:

- **Node**: Description of a functional element of system.
- **Function**: Purpose of the node. What is the node for.
- **Deviation**: Possible deviation of a parameter of the node. The parameters may be "Pressure", "Flow-rate", "Temperature", "Level", "Composition"... Deviation is guess by systematic application of key words: "More", "Less", "No", "Too high"... One line of the table stands for one deviation.
- **Causes**: Are indicated the possible causes of the deviation.
- **Effect**: Possible effect caused by the deviation on the system and the process. Currently set up means of reduction are not taken into account yet at this stage of the analysis.
- **Means of reduction**: Are indicated the risk reduction means. One may act over the causes to reduce the happening probability of the risk, or one may act over the consequences to minimize its severity.
- **L** (Likelihood): Is assessed the happening frequency of the deviation while taking into account the currently set up risk reduction measures.
- **S** (Severity): Is assessed the severity level of the effect, taking into account the risk reduction means. Severity classes are presented below.
- **C** (Criticality): Criticality is a combination of the likelihood and the severity of a risk.
- **A** (Action): Guidelines to be implemented to reduce the residual risks. Guidelines must be implemented when the criticality of the risk is high.
- **Comments**: Comments.
- **Reference (Ref)**: Identification of the row.
Risk levels

<table>
<thead>
<tr>
<th>Level</th>
<th>Wording</th>
<th>Expected rate of occurrence</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Unlikely</td>
<td>Has never happened before, or has happened before and has been completely cleared</td>
</tr>
<tr>
<td>2</td>
<td>Possible</td>
<td>Happened before, have been cleared on a different system or environment</td>
</tr>
<tr>
<td>3</td>
<td>Frequent</td>
<td>Happens regularly. There is no way to tackle the risk nor Air Liquide experience on this matter.</td>
</tr>
</tbody>
</table>

*Table 2: Probability classes*

Severity Level

The severity level is categorized with respect to the nature of the effect:

- **Safety**: Person safety working on the system or near-by, impact on the environment
- **Availability**: system availability, ability of the system when it is meant to produce

<table>
<thead>
<tr>
<th>Impact</th>
<th>Safety</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minor injury</td>
<td>First Aid only</td>
<td>Minor loss or facility damage</td>
</tr>
<tr>
<td>Serious injury</td>
<td>Medical treatment</td>
<td>No impact to the client</td>
</tr>
<tr>
<td></td>

<tr>
<td></td>
<td></td>
<td>Return on investment is badly hit</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Impair to the client</td>
</tr>
</tbody>
</table>

*Table 3: Severity classes*

Level of Criticality

Criticality is a combination of the likelihood and the severity of a risk, according to the table below.

<table>
<thead>
<tr>
<th>Severity</th>
<th>Likelihood</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>

<td>2</td>
<td>2</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>3</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*Table 4: Risk assessment categories*
Direct assessment of the criticality

In some studies, the level of criticality may be assessed directly according to the criteria below:

- Criticality I: Risk mitigation measures are effective so that the residual risk is minor. It is said that risk is under control. There is no need for extra risk mitigation measure.

- Criticality II: Residual risk is not satisfactory. Extra risk mitigation measures (preventive measures, detection, protection) are required.

- Criticality III: Residual risk cannot be bear. Risk mitigation measures are definitely required. When no solution is identified or when measures failed to be completed, the project must stop.
HAZOP – Hazard and Operability study

- The purpose of a HAZOP study is to analyze the operation integrity of a system. A HAZOP identifies the effects of deviations that might occur during normal operation of the system.

- Objectives of HAZOP study:
  - Identify the risks of malfunction of an installation (reliability, safety or the environment)
  - Check the installed means of detection and protection
  - Recommend changes in the design and/or fitting of protection systems and means of detection to reduce the level of risk
  - "Inductive reasoning" type analysis (Causes → Results)

HAZOP – Hazard and Operability study

- HAZOP Method detailed in Risk Management Procedure PMR-G-04
- Tool used for HAZOP

Method

- The concept involves investigating how the plant might deviate
