

CAREY'S 85 PER CENT MAGNESIA COVERINGS

FOR THE HEATED SURFACE OF PIPES AND BOILERS

You can easily lose in fuel an amount representing many times the cost of an up-to-date installation of **Carey's Coverings**.

The constant radiation of heat through pipes and boilers carrying steam anywhere from 212 degrees upwards is something to be avoided as the outright loss of available heat is enormous.

It would be better and more economical to confine the heat in the pipes.

Now the best way to do this is to apply Carey's Coverings.

They are fireproof and thorough non-conductors of heat.

They not only prevent radiation but the condensation of steam as well, and obviate the necessity of excessive firing, thus reducing to the minimum the amount of fuel necessary to operate your plant.

In six or eight months enough fuel is saved to repay their original cost. The most prominent plants in the world use Carey's Coverings. They are U. S. Government standards.
