Dearborn Feed Water Treatment for Use in Steam Boilers

To Prevent Scale Formation, Corrosion, Pitting and Foaming

The only safe and common sense way to overcome the injurious action of boiler feed waters is to treat them scientifically, with preparations containing suitable reagents for the mineral salts which cause the trouble, these reagents being selected and properly proportioned, after careful analysis of the water has revealed what the mineral content is; the preparation to be fed into the boiler constantly, so that all of the water will be treated, and all of the mineral salts neutralized before they can affect the boilers.

**THIS IS THE DEARBORN METHOD
DOES IT APPEAL TO YOU?**

Gallon sample of water required for analysis
