

# *The* **BEST**

The illustration is split into two parts. On the left, a detailed line drawing of a coal mine with multiple levels, tracks, and a steam locomotive. On the right, a man in a suit and tie is seated at a desk in a laboratory, writing on a piece of paper. Behind him are shelves filled with various glass bottles and laboratory equipment.

# **Coal Analysis**

**L**ABORATORY TESTS are made under ideal conditions which are seldom obtained in the average steam plant. Laboratory performance is not always an accurate measure of what the coal may be expected to do in your boilers.

**The best coal analysis is a  
test made *in your own plant*,  
over a reasonable period,  
and under varying conditions**

In determining what grade and size of coal is most satisfactory and economical we can help materially. Our Combustion Engineers know exactly how to get maximum results from our coal. Their suggestions and advice have assisted in promoting fuel economy in the plants of many of our customers.

*The services of Peabody Engineers  
may be had without obligation.  
Inquiries are invited.*
