

IPRO-313 Fall 2007

Ultra-High-Speed Market Data System

Sponsor: Townsend Analytics

Manager: Carl Ververs

Illinois Institute of Technology

Advisors: Wai Gen Yee

Ben Van Vliet

Design Team:

Students: Philip Pannenko
Devaraj Ramsamy
Kenneth Buddell

Hardware Team:

Michael Lenzen
Yunseok Song
Noh Hyup Kwak
Jong Min Lim

Software Team:

Jongyon Kim
Young Cho
Usman Jafarey
Jesus Allan C Tugade
Jong Su Yoon

Objective:

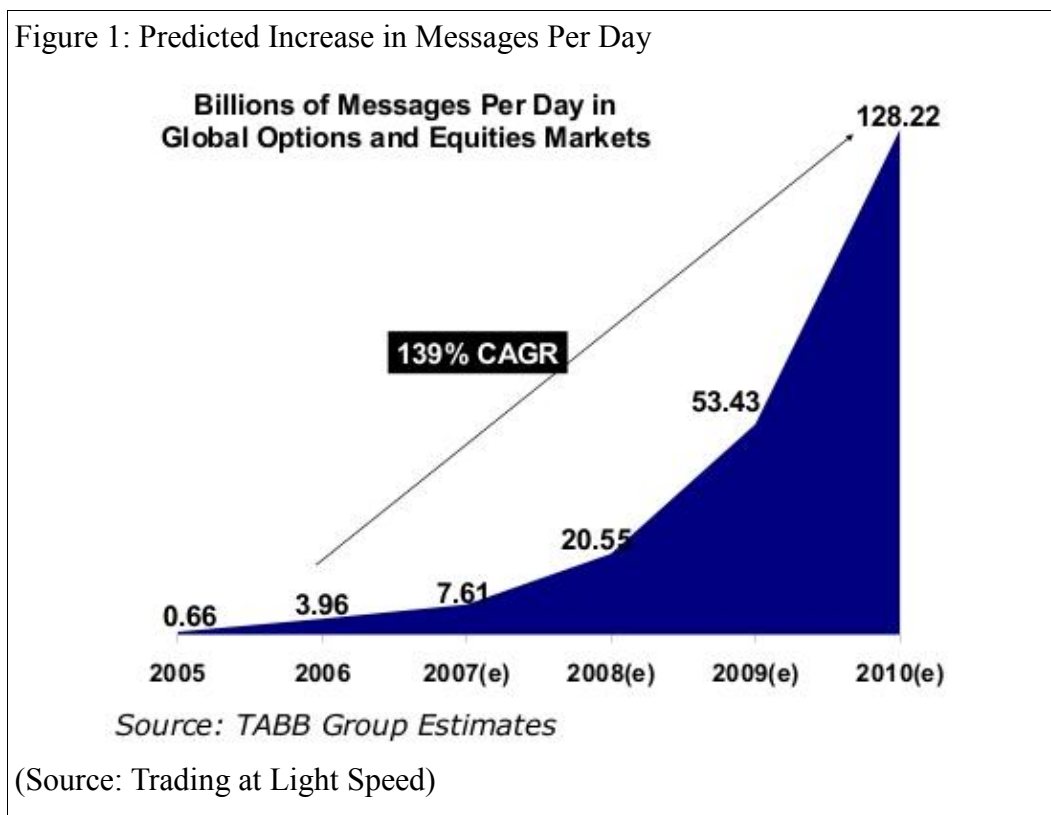

I PRO 313's objective is to develop a data ticker plant for our sponsor Townsend Analytics which needs to meet or exceed certain performance requirements. The data ticker plant has to have a sustained optimal throughput of three million price quotes per second and minimize latency while maintain specific constraints. The ticker plant aggregates streaming data for numerous global financial markets and disseminates the data to thousand of users in real time. The data is used in Townsend Analytics' RealTick® Execution Management System (EMS), its flagship institutional product for the financial services industry. Thus, timely and accurate data delivery is a critical component to Townsend's product and competitive position. Through research and development, the group will have a concept of design, prototype development and benchmark testing. Additionally, the groundwork will be laid for future development of the ticker plant and additional trading-platform components.

Our group prioritized objectives as follows:

- Research low latency discussions and reports
 - Fully understand what a ticker plant is and does
 - Learn about new methods for ticker plants and explore their advantages and disadvantages
 - Understand market use
- Explore competitors' solutions
 - Know what is currently on the market
 - Better understand implementation of ticker plant architecture
 - Understand what works and what does not
- Develop a functioning ticker plant system
 - Analyze ticker protocols used
 - Design ticker plant architecture
 - Code a working small system
- Determine hardware requirements
 - Test off-the-shelf hardware for system
 - Design custom hardware configuration
 - Compare each solution
- Benchmarks & Prototype
 - Integrate hardware and software designs
 - Prepare benchmarks
 - Document technical user manual

Background:

From the creation of the first stock ticker on the floor of the New York Stock Exchange (NYSE) in 1867, one thing was set in stone: speed meant money. Now if we fast forward to the 21st century we find out the same is true; worse, after the implementation of the computers and automatic trading algorithms, so much information is on the nets now that, it is all becoming unmanageable! [1]

Townsend Analytics (TAL), a direct-access trading-system vendor, provides connectivity to a multitude of electronic-communications networks and stock exchanges:

Servicing the global capital markets for over 20 years, Townsend Analytics Trading Services offers world class trading and trade order management solutions to the institutional- portfolio management and broker dealer- marketplace. In today's competitive institutional trading environment, portfolio managers and traders are under increasing pressure to access a wider variety of liquidity sources, employ more aggressive yet cost efficient trading strategies and achieve best execution faster than ever. Achieving this demands the right service bureau partner, powerful order management/reporting tools and direct access to a variety of electronic markets across multiple asset classes. [2]

TAL has already developed a means for FH which has captured both the United States market as well as the European market:

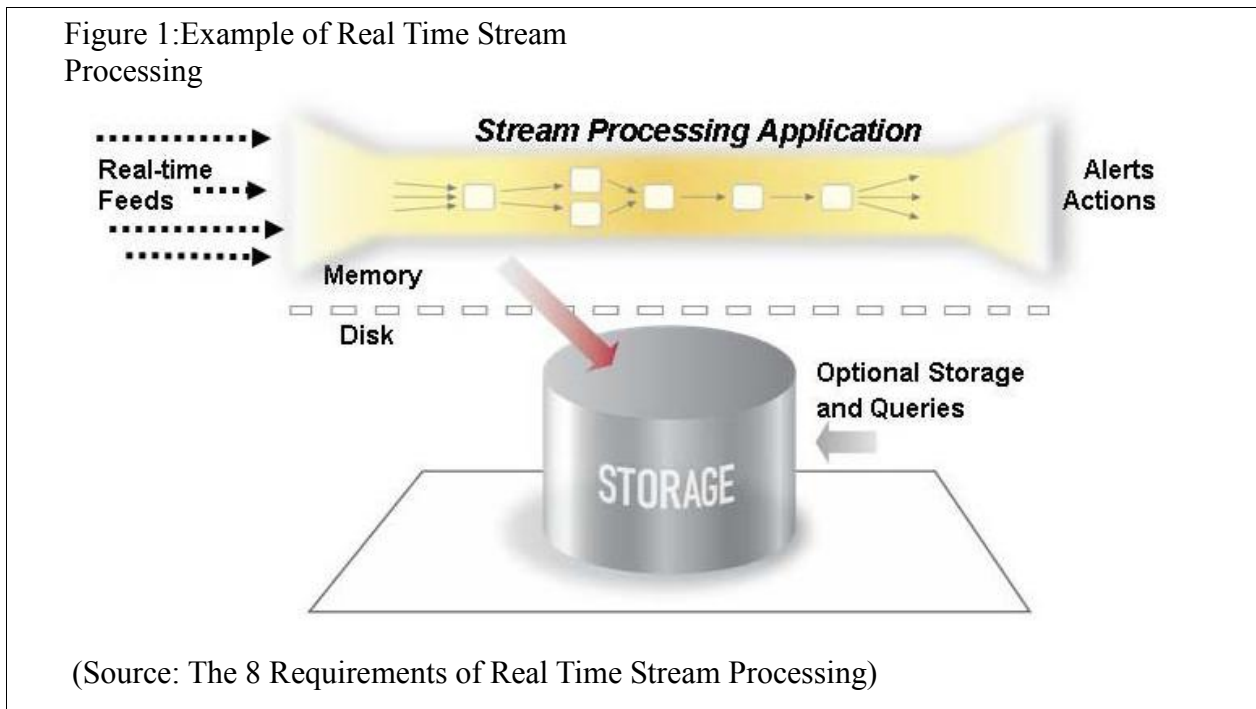

Powered by RealTick®, Townsend Analytics' flagship institutional product, RealTick EMS (Execution Management System) is the institutional financial service industry's leading multi-asset, multi-broker, multi-routing and multi-regional market data, analytics and direct market access (DMA) trading platform. [2]

Currently there are a few firms that address this same problem; Exegy, Wombat & RMDS are examples of such. These companies however lack an effective system that will aggregate the amount

of expected data in the next few years. Exegy currently claims to be the leading provider of aggregation of data at two million messages per second. They achieve this by using specific hardware and software configurations.

If TAL hopes to increase data flow by doubling processing power to their current solution, though bottlenecks will simply appear in different areas in their design. This approach leads to diminishing returns and is only a short-term solution to the problem.

IPRO 313 will research current approaches by TAL and their competitors and evaluate the cost benefits of each approach. Then, according to this research, the team will develop a prototype which will demonstrate:

Stream Processing Application:

- Translation of ticker data
- Archiving complete ticker information

Storage & Queries:

- Normalization of incomplete data
- Accessing cache values
- Distributing tickers according to subscriptions

Reduce Bottlenecks:

- Optimize architecture to streamline data delivery performance
- Reduce latency

By the end of this IPRO, the team will provide a proof of concept, complete with benchmarks, and a technical and user manual. Also, annotated research papers, competitors' system reviews & comparison charts will be included as extra appendices.

Methodology:

The IPRO group is broken down into three teams: Design, Hardware and Software. Each team is responsible for researching and developing solutions within its specific area, but also informs and collaborates with the other teams of their findings. Each team will draft its own reports, schedule and presentations. Additionally, each team will report to the group weekly, so that the information is presented in a timely and consistent manner. With a weekly schedule of presentations and reports, the flow of information is communicated to everyone on the project and the oversight of work is being maintained. Documents generated from each group are to support the IPRO deliverables, so that they can be streamlined into a comprehensive deliverable.

The Design team is responsible for all IPRO deliverables and deadlines and for managing the work flow of the entire project. It is also responsible for communicating weekly with the sponsor on the progress of work done for the past week and for upcoming work. The design team, aside from taking a managerial role, will conduct research on the financial industry. Research topics include competitors, regulations, protocols, and overall market conditions now and expected future market conditions.

The Hardware team will determine whether or not standard off-the-shelf hardware will meet the requirements both now and in the future. We will justify our decision with research into the growth in hardware capabilities and analysis of different current hardware configurations through experimentation. If the case is that standard servers will not suffice we will come up with a proposal for a solution that will work and justify why we think that it will work the best. The hardware design encompasses more than just the design of each machine, but also the overall design of the system. We will also analyze competing products, determining what they are using and why.

Work throughout the semester will include:

- Creation of tests and benchmarks to simulate demand on the system
- Test simultaneous network I/O by testing the maximum throughput while varying message sizes and ratio's of input to output
- Testing of data access times and data updates
- Coordinate work with software team in development of the macro-design

The software team will focus on Data Streaming and Last Value Cache in the processing system over this semester with methods via research into relevant paper from academic side and benchmark other systems from industrial side. We will propose reliable solutions and implement programs with statistical data. Major deliverables for the software groups are:

- Design (Ticker Plant System)
- Codes for Normalizing/Caching Components
- Data Generator
- Benchmarks / Test Results
- Documentation
- Technical Manual
- User Manual
- Actual executable system to show the inputs and outputs (integrating into the H/W configuration)

Expected Results

Design:

The primary result is a functioning prototype that can meet or exceed the requirements from the sponsor. We will present the results from the hardware and software group along with our own research to Townsend Analytics and on IPRO day. Additionally, we expect that further research into trading architectures will continue in subsequent IPRO teams, with our work being the foundation for future work for Townsend Analytics.

Hardware:

A major part of our results will be our contribution to the Industry Report. We will have analysis of the current systems in use by competitors.

We will also have all of the data from our hardware testing, including measurements for each of our tests for different hardware configurations. The results of each test will be measured in the number of messages that can be handled per second. We will then be able to compare the capabilities of different parts of the system to determine where bottlenecks are located.

We will have a plan for future work based on our suggestions for improvement. We will have a design of what we think, based on research and testing, an optimal system would be. Due to constantly advancing technology this is a moving target, but the overall design should not be outdated too quickly.

Software:

Our major result as for the software group will be a written source code for each of modules that have been designed for the ticker plant. As part of the Phase 1, we will be focusing on the caching and streaming process mostly, and will have the conceptual design for the whole system. The components will be tested during the development and will be provided with the analysis based on the testing result.

Project Budget (Preliminary):

| <u>Name</u> | <u>Description</u> | <u>Price</u> |
|---------------------|------------------------------------|--------------|
| IPRO Items | | |
| Paper | Brochure, Abstract, Summary Sheets | \$20 |
| Poster | Poster board/printing | \$30 |
| Printing | Color printing | \$40 |
| | | |
| TAL Meetings | Lunches with sponsor | \$100 |
| | | |
| Hardware | | |
| | TBD | TBD |
| | | |
| | Total | \$190 |

Schedule of Tasks and Milestone Events:

| <u>Task Name</u> | <u>Time</u> | <u>Start</u> | <u>Finish</u> | <u>Resources</u> |
|---|--------------------|---------------------|----------------------|-------------------------|
| <u>Research & Developing</u> | | | | |
| Last Value Cache | 2 Weeks | 1-Oct | 13-Oct | Software |
| Stream Processor | 2 Weeks | 1-Oct | 13-Oct | Software |
| Competitors Documentation | 10 Days | 16-Sept | 26-Sept | Hardware |
| Annotating White Papers | 1 Week | 6-Oct | 13-Oct | Design |
| Market Terms/Value | 2 Week | 1-Oct | 13-Oct | Design |
| <u>IPRO Midterm Report</u> | | | | |
| Midterm Report | 1 Week | 10-Oct | 26-Oct | Design |
| Ethics Paper | 1 Week | 10-Oct | 17-Oct | Design |
| Oral Report | 1 Week | 10-Oct | 17-Oct | Design |
| <u>Test</u> | | | | |
| Determining Test Case Format | 1 Week | 8-Oct | 15-Oct | Design |
| Module Performance | 2 Weeks | 15-Oct | 27-Oct | Software |
| Modify Code | 2 Weeks | 15-Oct | 27-Oct | Software |
| Simultaneous Network I/O | 2 Weeks | 27-Sept | 9-Oct | Hardware |
| Data Access Times & Updates | 2 Weeks | 27-Sept | 9-Oct | Hardware |
| <u>Analysis & Improvements</u> | | | | |
| Designing Guidelines For Next Phase | 1 Week | 27-Oct | 5-Nov | Software |
| Proposing of New Features | 1 Week | 27-Oct | 5-Nov | Design |
| 64 Bits vs. 32 Bits | 2 Week | 11-Oct | 29-Oct | Hardware |
| Multiple Network Cards | 2 Week | 11-Oct | 29-Oct | Hardware |
| <u>Integration</u> | | | | |
| Components Tested As Whole | 3 Weeks | 29-Oct | 17-Nov | ALL |
| Error Debugging & Correction | 3 Weeks | 29-Oct | 17-Nov | ALL |
| <u>IPRO Deliverables</u> | | | | |
| Poster | 2 Weeks | 17-Nov | 30-Nov | Design |
| Final Report | 2 Weeks | 17-Nov | 30-Nov | Design |
| Presentation | 2 Weeks | 17-Nov | 30-Nov | ALL |
| Technical Write Up | 2 Weeks | 17-Nov | 30-Nov | Hardware |
| User Manual | 2 Weeks | 17-Nov | 30-Nov | Software |
| Industry Report | 2 Weeks | 17-Nov | 30-Nov | Design |
| Benchmarks | 2 Weeks | 17-Nov | 30-Nov | Hardware |

Individual Team Member Assignments:

| Group Members | Major | Skill & Strengths | Experience | Roles |
|----------------------|------------------------|--|--|--|
| Design Team | | | | |
| Philip Pannenکو | Computer Science | Management & Communication | CBOE employment | IPRO Team Leader; Agenda Maker |
| Devaraj Ramsamy | Business | Project Controls | Bechtel SAIC LLC, DOE Yucca Mountain Project | iGROUPS & Deliverable Management |
| Kenneth Buddell | Business | | Previous IPRO experience | Timesheet Summarizer Industry Research |
| Software Team | | | | |
| Jongyon Kim | Business | | | IPRO Sub Team Leader; Minute Taker; Timesheet Summarizer |
| Young Cho | Applied Math | | | |
| Usman Jafarey | Computer Science | | | |
| Jesus Allan C Tugade | Computer Science | | | |
| Jong su Toon | Computer Science | C, C++, Java, Oracle, PHP | Online Game Company | Software Coding |
| Hardware Team | | | | |
| Michael Lenzen | Applied Math | Java, JavaScript, PHP, Perl | Web start-up company | IPRO Sub Team Leader; Timesheet Summarizer |
| Yunseok Song | Electrical Engineering | C, Matlab, Circuit Analysis | | Research |
| Noh Hyup Kwak | Electrical Engineering | Java, Verilog, Circuit Analysis | CLSI Design Automation Lab | Research |
| Jong Min Lim | Electrical Engineering | Statistical Analysis, Circuit Design | Power Analysis ComEd | Network Analyst |
